EXP:1	Setting up the Python environment and libraries

CODE:

```
# Import required libraries
import ipywidgets as widgets
from IPython.display import display

# Create an integer slider
slider = widgets.IntSlider(
    value=50,
    min=0,
    max=100,
    step=1,
    description='Value:'
)

# Create an output widget
output = widgets.Output()

# Function to display slider value
def on_value_change(change):
    output.clear_output()
    with output:
        print(f'Slider value is {change["new"]}')
```

```
# Observe changes in slider value
slider.observe(on_value_change, names='value')

# Display the slider and output
display(slider, output)
```

OUTPUT:
